

Stacked matched difference-in-differences: event-study coefficients

Notes. Unit (event $\times$ firm) and calendar-month fixed effects; 95% intervals cluster on events (n = 286). Joint pre-quarter Wald tests: level $\chi^2(3) = 0.55$ (p = 0.908); state $\chi^2(3) = 0.112$ (p = 0.990). The state variable is the target's continuous pre-deal state, centred at the event mean.
